

MULTI-FUNCTION PERIPHERALS

ABSTRACT

A multi-function peripheral includes a casing, a scanning module and a printing
5 module. The casing has a recording media path. The scanning module is located on the
recording media path for selectively scanning recording media fed into the casing from
the recording media path. The printing module also is located on the recording media
path for selectively printing the recording media. The recording media are then
discharged out of the casing through the recording media path. Thus the multi-function
10 peripheral can reduce the number of elements, simplify replacement of the inkjet
cartridge of the printing module, reduce the dimensions, lower the element cost and
diminish the complexity of the mechanisms.
